algebraic structures ii

math 361
 3 credits
 bouillon 110
 mwf - 2:00pm

text:

(1974). larsen, m. *introduction to algebraic structures*. new york: addison wesley. (cwu coursepack)

description:

a continuation of math 360.
 modern abstract algebra represents a subdiscipline of mathematics with great unifying power. we will study more "group theory," this quarter as well as an introduction to the theory of rings. again, this is essentially the study of symmetry. modern algebra has its origins in classical algebra, geometry, number theory, and analysis, with themes reaching as far back as ancient egypt, mesopotamia, and the islamic world.

there will be three aspects to this course. we first undertake a survey of the history of abstract algebra with a special emphasis on classical algebra and the solution of polynomial equations. the second theme of the course is an introduction to abstraction and will be based on our text. finally, we will study groups, rings, and introduce ourselves to the preliminary concepts of fields, deceptively simple mathematical objects, in two ways: deductively (we will prove stuff about groups, again based on our text) and visually (we will construct diagrams to illustrate the properties of these creatures).

what, you might ask, is a group?

a group can be considered a collection of "*actions*" on a physical object that changes the orientation of the object, but not the actual space it fills. for example, imagine you have a rectangle on a table in front of you with each vertex numbered. you are allowed to rotate the rectangle clockwise 180 degrees so that the rectangle occupies the same space on the table but the numbered vertices are in different locations. you may also flip the square about a line that runs through the midpoints of two opposite sides. there are several such actions that change the orientation of the vertices but not the actual space it occupies. the collection of all such actions that satisfy certain

properties is said to form a group. simple, no?

there are some links in the left sidebar of this page. take the time to explore what some people in other universities are interested in. there are other possibly useful links back at my [home page](#).

this quarter we will continue our march as deeply as is reasonable into our text. the first three chapters of or text, supplemented by lectures introducing the the history of group theory, and visualizing groups.

check out the spring 2010 class calendar.

evaluation:

your grade will be determined by **two midterms** (30% ea.) and a **final examination** (40%). the first midterm will take place (and be graded) before the deadline for dropping the class. grades will be assigned on a 90%-80%-70%-60% scale. i do give A-'s, B-'s, and C-'s. occasionally, the lines between A-/B+, etc. are lowered, but **never** raised. in other words, if your average is 90% then you will receive some sort of an 'A.'

you will also be required to keep a notebook that will be collected and graded on a "pass/fail" basis. in order to receive the grade you have earned on the exams, you must receive a "pass" on the notebook. a "fail" on your notebook will result in a grade of "incomplete." your notebook will be *single-subject, looseleaf and have four sections*:

- *lecture notes* (complete, with each lecture dated)
- *homework* (complete)
- *visual examples of finite groups* (with cayley diagrams, multiplication tables, cycle graphs, hasse diagrams, and objects of symmetry ... huh? :)
- *handouts and miscellaneous* (tba)

i collect selected homework assignments and we will have several unannounced, but straight-forward, quizzes to help you see where you stand regarding the content of the course.

if you have any questions or comments, feel free to come by my office or e-mail me at the address below.

student learner outcomes

the most important things you learn in school are not going to be measurable, sorry. in fact, the absolute best service a list of 'student learner outcomes' could possibly provide is as a random sample of behavioral objectives. that said, at the end of this course, you will have a reasonable facility (as measured by the evaluation procedures described above) in describing the nature of groups deductively and visually. along

the way you will be able to describe to others what is meant by the following: mappings, equivalence relations, binary operations, groups, subgroups, cosets, normal subgroups, homomorphisms, isomorphisms, and (with a little luck this spring) why any of this could possibly help us decide whether or not polynomial equations may, or may not, have what has been described as a "solution by radicals."

note

students with disabilities who wish to set up academic adjustments in this class should give me a copy of their confirmation of eligibility for academic adjustments from the disability support services office so that we can meet in order to discuss how the approved adjustments will be implemented in this class. students with disabilities without this form should contact the disability support services office, bouillon 205 or dssrecept@cwu.edu or 963-2171 as soon as possible.

no, no, no!

no late assignments, no early tests, no late tests, no make-up tests (including finals ... be there).
